

Jurisdiction-level Vulnerability Assessment
Project
Emergency Response:
Public Health Crisis Response-
2018 Opioid Overdose Crisis Cooperative
Agreement

Final Report and Data Maps

Monmouth County, New Jersey

August 7, 2019

Project Overview

The Centers for Disease Control and Prevention (CDC) provided funding to states that are affected by the opioid epidemic. The rationale of the public health crisis finding is to advance the understanding of the opioid overdose epidemic and scale up prevention activities across all 50 states and Washington DC.

The United States is in the midst of an opioid overdose epidemic. On average, 115 Americans die every day from an opioid overdose, and more than 630,000 people have died from a drug overdose from 1999 to 2016. In 2016, the number of overdose deaths involving opioids (including prescription opioids and illegal opioids like heroin and illicitly manufactured fentanyl) was five times higher than in 1999. Hepatitis C, a bloodborne pathogen, has high rates of transmission among persons who inject drugs.

The funding covers different domains that include Strengthen Incident Management for Early Crisis Response, Strengthen Jurisdictional Recovery, Strengthen Biosurveillance and Strengthen Information Management.

The New Jersey Department of Health (NJDOH) submitted various proposals that spanned domains. NJDOH's Public Health Infrastructure, Laboratories, and Emergency Preparedness (PHILEP) coordinated the cooperative agreement application for the department. The CDC approved funding for a project between the NJDOH Communicable Disease Service and the New Jersey Association of County and City Health Officials (NJACCHO).

The Opioid and Bloodborne Pathogen Transmission Vulnerability Assessment Project was funded in Domain 2: Strengthen Jurisdictional Recovery. This project is a collaborative effort between the NJDOH and NJACCHO. The initial goal of the project was to conduct vulnerability assessments to identify resources in 14 counties to identify areas at high risk for opioid overdoses and bloodborne pathogens (BBP) associated with non-sterile injection drug use. The 14 counties were selected because of the prevalence of hepatitis C per populations and those counties identified as High Intensity Drug Trafficking Areas (HIDTA). HIDTA counties are included in the project, as injection drug use has been linked to the opioid epidemic. NJACCHO modified the initial goal to expand data collection to all 21 counties.

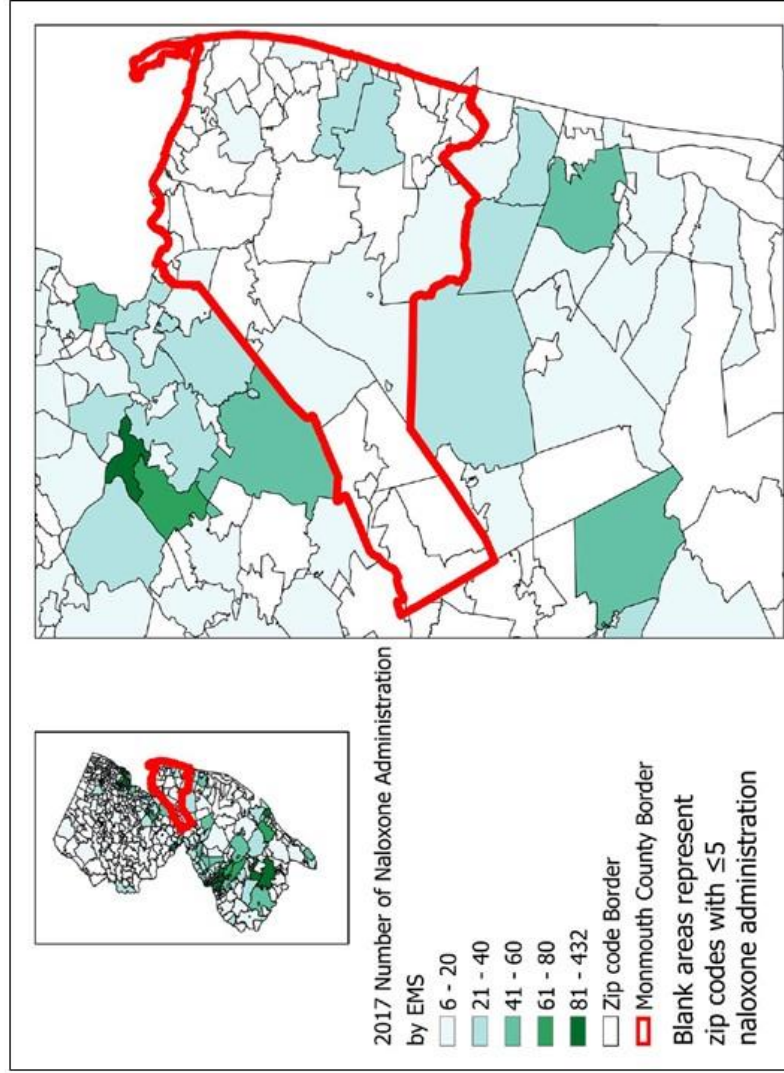

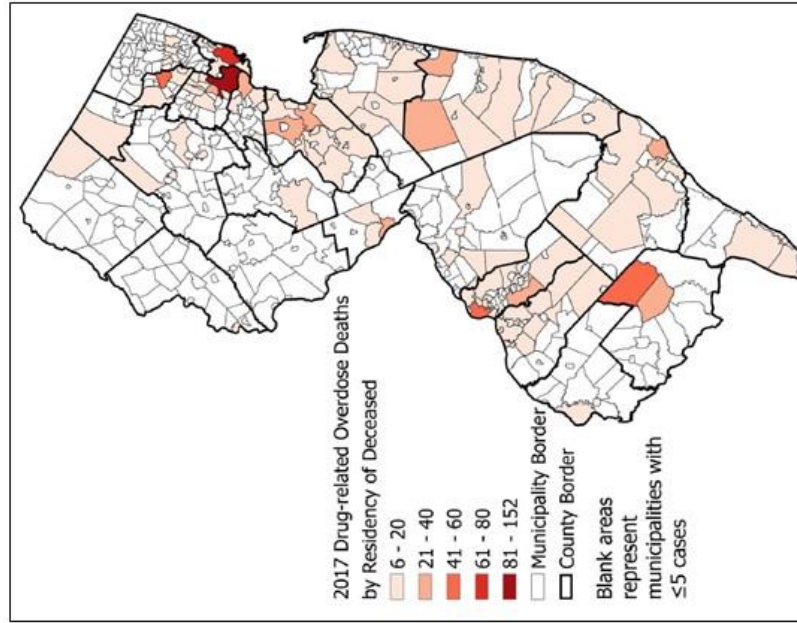

In addition to the vulnerability assessments, NJACCHO worked with stakeholders and partners to develop plans that identifies and allocates prevention and intervention services for opioid and prevention of BBPs. NJACCHO expanded the initial goal of assessing 14 counties to all 21. At the conclusion of the project, the expanded efforts lead to 18 county meetings with stakeholders and partners, and 18 fully complete vulnerability assessments.

NJACCHO in collaboration with NJDOH collected the following data indicators for 2017 at the municipality level, broken into risk factor, harm reduction and social determinants of health categories:

Risk Factors	Harm Reduction	Social Determinants of Health
Overdose Deaths	Syringe Access Locations	Living Below the Poverty Level
Naloxone Administrations (EMS)	Bloodborne Pathogen Testing Sites	Unemployment Rates
Hepatitis C Rates	Municipal Alliances	
HIV/AIDS Rates	Rx Drop Box Locations	
Drug Related Arrests	Licensed Opioid Treatment Programs	
	Medication-Assisted Treatment (MAT) Locations	
	Drug Detox Locations	
	Sober Living Houses	

The remainder of this report will provide the Geographic Information System (GIS) mapping of the indicators above, at the municipality level. These GIS maps serve as a visual representation of the locations of prevention and intervention services and resources and will assist with identifying which services and resources are needed in the county to fight the opioid epidemic.

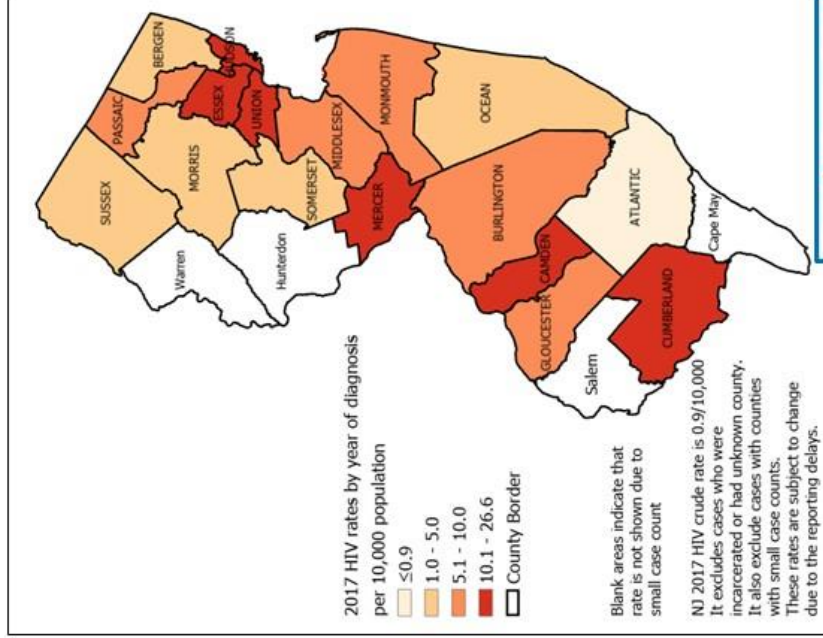

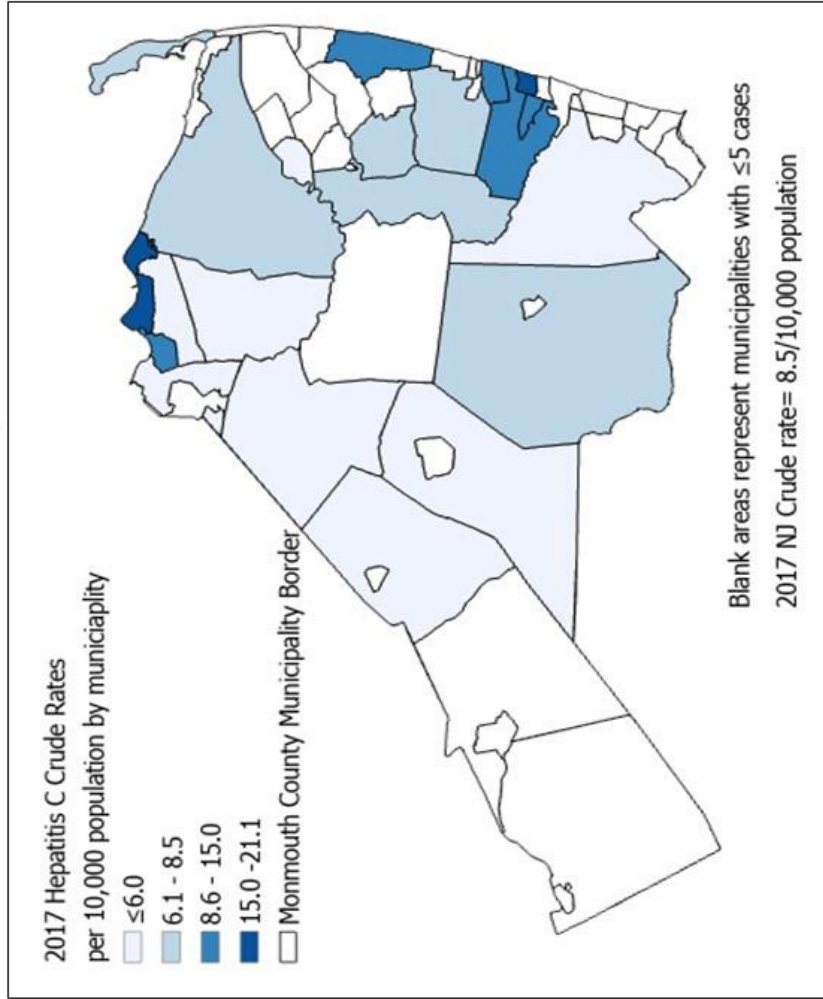

Monmouth County Known Risk Factors

Data source: Drug-related overdose deaths data were obtained from Center for Health Statistics and Informatics of NJDOH and Naloxone Administration data were obtained from NJDOHEMS
 Maps Created 7/15/2019

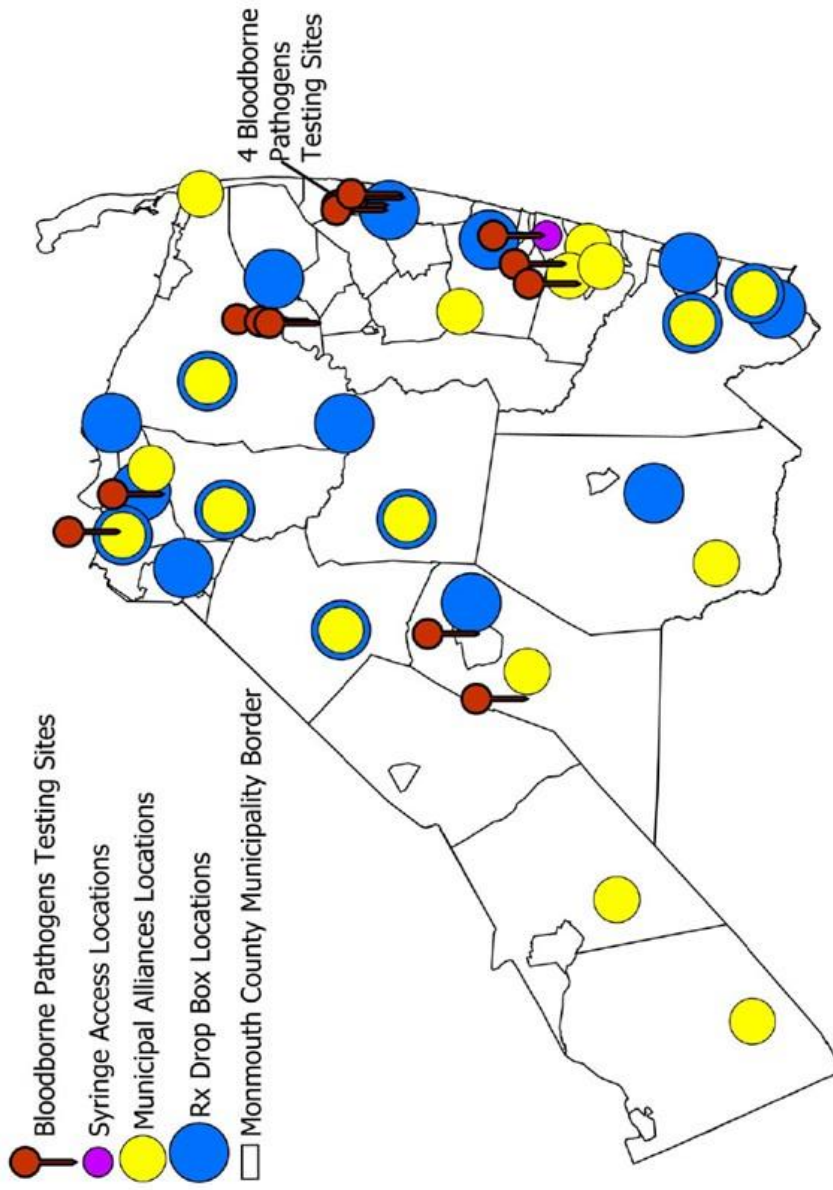

Monmouth County Hepatitis C and HIV Rates

Data Source: Hepatitis C data were obtained from Communicable Disease Reporting and Surveillance System
 HIV/AIDS data were obtained from <https://www.nj.gov/health/hivactdb/>

Monmouth County Plan

Challenges:

1. General lack of awareness from community and professionals' connections to drug users about current resources for screening, treatment and long-term recovery services.
2. Limited priority placed on risk of blood borne pathogens (BBP) transmission in injection drug use population.
3. First responders are most likely to interact with drug users, but not equipped with knowledge or information to provide resources to individual or their family. Limited resources also exist at hospitals if Recovery Specialist is not available to discuss treatment options.
4. Stigma exists from the community level through treatment professionals and impacts community education, successful linkage to care, treatment options, family support and long-term recovery.
5. Limited options and capacity for detox, treatment and long-term recovery services within the County.
6. Misinformation and stigma related to Medication Assisted Treatment (MAT) has led to limited access within the County. The medical community does not fully understand the licensing requirements, liability and effectiveness of the treatment.

Opportunities & Future Actions:

1. Utilize the current Overdose Fatality Review Task Force to promote additional cross sector work and to clearly define specific roles in prevention, screening, response, treatment and long-term recovery for injection drug users at risk for BBP. Specific sectors to consider include:
 - a. Medical Community, Primary Care Practitioners and other Prescribers
 - b. Public Health Departments
 - c. Prevention Organizations
 - d. Treatment Facilities
 - e. Recovery Specialists
 - f. Law-Enforcement and other First Responders
 - g. Community
 - h. Parents and Families
 - i. Schools
2. Determine what sectors or individuals are missing from the Overdose Fatality Review Task Forces' work and engage their participation. Continue to strengthen the cross-sector partnership, information sharing and educational opportunities.

3. Provide educational opportunities for Overdose Fatality Review Task Force members and other community stakeholders. Specific items can include:
 - a. BBP transmission, screening, prevention and treatment
 - b. Prescription drug use and addiction
 - c. Process of addiction and recovery
 - d. All treatment options
4. Utilize existing information sharing platforms and networks from partnerships to increase awareness of risk factors for opioid use and BBP transmission. Provide education on vaccination and other prevention opportunities, screening and treatment of addiction and BBP.
5. Evaluate the models currently being used in 5 municipalities within the County working to connect drug users to treatment instead of incarceration. Explore opportunities to expand to all County municipalities.
6. Create resources for those directly interacting with drug users, including Police Officers, EMTs, Recovery Coaches and Emergency Department Staff. Specific information related to screening for BBP, treatment and long-term recovery should be included.
7. Explore best practices in other Counties to operationalize services in a mobile capacity. This could provide more active connection to the community, providing education, testing for BBP and direct connection to Recovery Specialists.
8. Share the impact the Syringe Access Program model in place, the community impact of housing the center and the process of gaining approval throughout the State.
9. Evaluate the need and capacity for improving community support, services and education based upon the attached maps through continuous multi-sector quarterly meetings.
