

Jurisdiction-level Vulnerability Assessment
Project
Emergency Response:
Public Health Crisis Response-
2018 Opioid Overdose Crisis Cooperative
Agreement

Final Report and Data Maps

Warren County, New Jersey
August 7, 2019

Project Overview

The Centers for Disease Control and Prevention (CDC) provided funding to states that are affected by the opioid epidemic. The rationale of the public health crisis finding is to advance the understanding of the opioid overdose epidemic and scale up prevention activities across all 50 states and Washington DC.

The United States is in the midst of an opioid overdose epidemic. On average, 115 Americans die every day from an opioid overdose, and more than 630,000 people have died from a drug overdose from 1999 to 2016. In 2016, the number of overdose deaths involving opioids (including prescription opioids and illegal opioids like heroin and illicitly manufactured fentanyl) was five times higher than in 1999. Hepatitis C, a bloodborne pathogen, has high rates of transmission among persons who inject drugs.

The funding covers different domains that include Strengthen Incident Management for Early Crisis Response, Strengthen Jurisdictional Recovery, Strengthen Biosurveillance and Strengthen Information Management.

The New Jersey Department of Health (NJDOH) submitted various proposals that spanned domains. NJDOH's Public Health Infrastructure, Laboratories, and Emergency Preparedness (PHILEP) coordinated the cooperative agreement application for the department. The CDC approved funding for a project between the NJDOH Communicable Disease Service and the New Jersey Association of County and City Health Officials (NJACCHO).

The Opioid and Bloodborne Pathogen Transmission Vulnerability Assessment Project was funded in Domain 2: Strengthen Jurisdictional Recovery. This project is a collaborative effort between the NJDOH and NJACCHO. The initial goal of the project was to conduct vulnerability assessments to identify resources in 14 counties to identify areas at high risk for opioid overdoses and bloodborne pathogens (BBP) associated with non-sterile injection drug use. The 14 counties were selected because of the prevalence of hepatitis C per populations and those counties identified as High Intensity Drug Trafficking Areas (HIDTA). HIDTA counties are included in the project, as injection drug use has been linked to the opioid epidemic. NJACCHO modified the initial goal to expand data collection to all 21 counties.

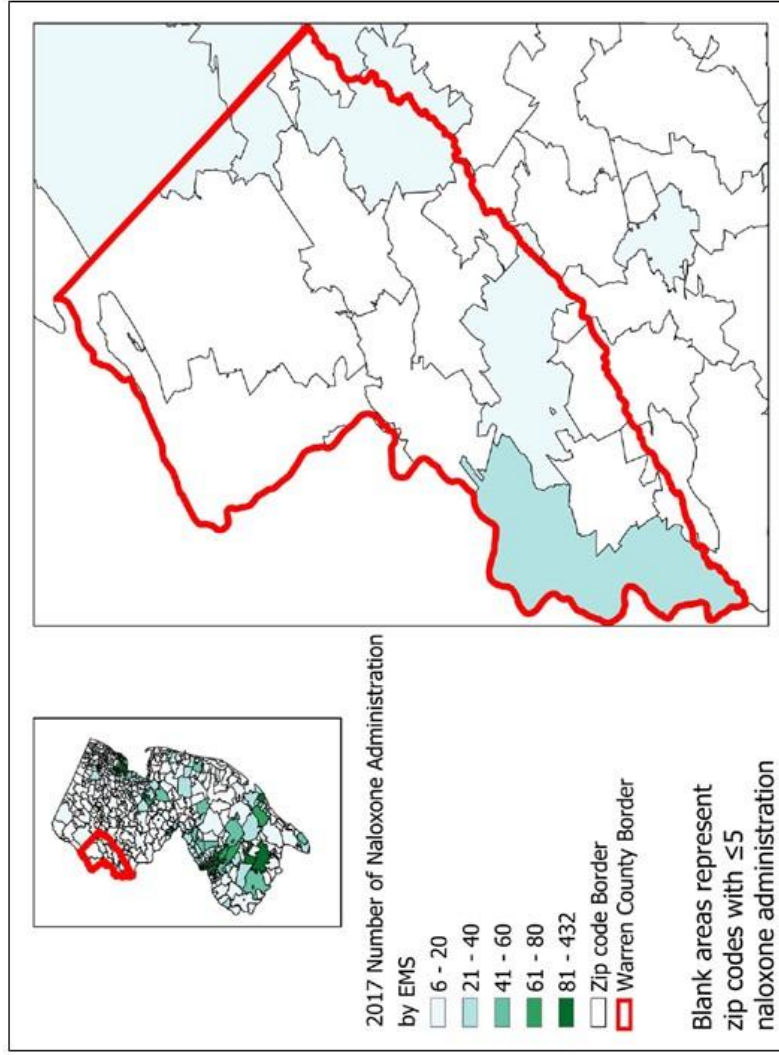

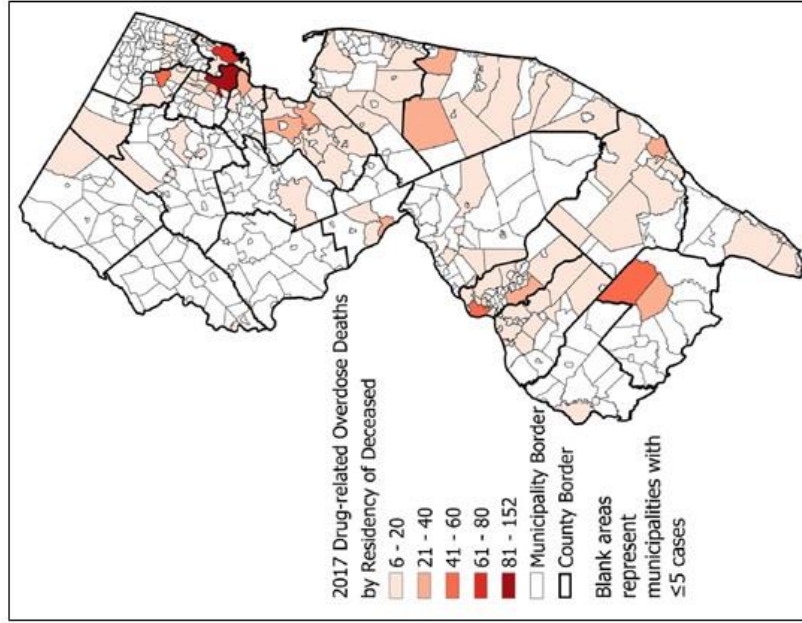

In addition to the vulnerability assessments, NJACCHO worked with stakeholders and partners to develop plans that identifies and allocates prevention and intervention services for opioid and prevention of BBPs. NJACCHO expanded the initial goal of assessing 14 counties to all 21. At the conclusion of the project, the expanded efforts lead to 18 county meetings with stakeholders and partners, and 18 fully complete vulnerability assessments.

NJACCHO in collaboration with NJDOH collected the following data indicators for 2017 at the municipality level, broken into risk factor, harm reduction and social determinants of health categories:

| Risk Factors | Harm Reduction | Social Determinants of Health |
|--------------------------------|---|--------------------------------|
| Overdose Deaths | Syringe Access Locations | Living Below the Poverty Level |
| Naloxone Administrations (EMS) | Bloodborne Pathogen Testing Sites | Unemployment Rates |
| Hepatitis C Rates | Municipal Alliances | |
| HIV/AIDS Rates | Rx Drop Box Locations | |
| Drug Related Arrests | Licensed Opioid Treatment Programs | |
| | Medication-Assisted Treatment (MAT) Locations | |
| | Drug Detox Locations | |
| | Sober Living Houses | |

The remainder of this report will provide the Geographic Information System (GIS) mapping of the indicators above, at the municipality level. These GIS maps serve as a visual representation of the locations of prevention and intervention services and resources and will assist with identifying which services and resources are needed in the county to fight the opioid epidemic.

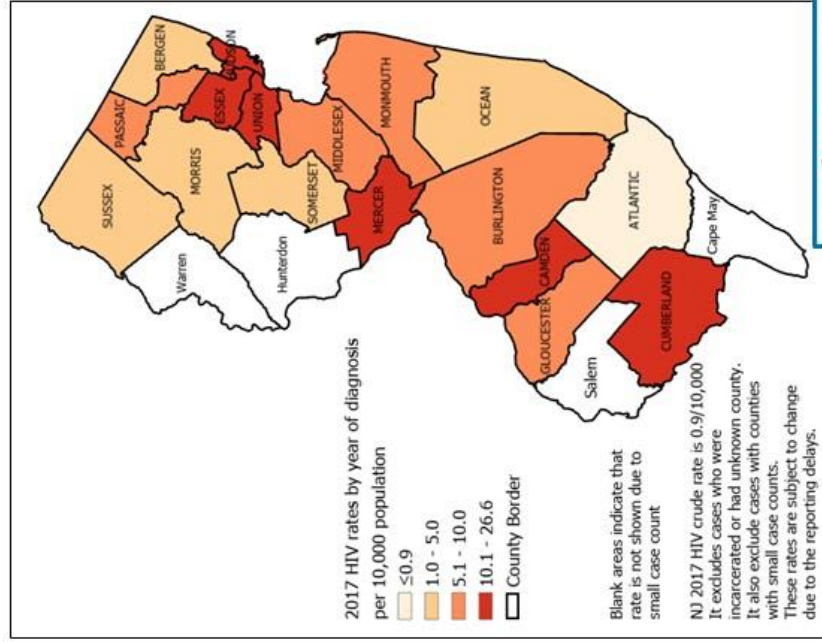

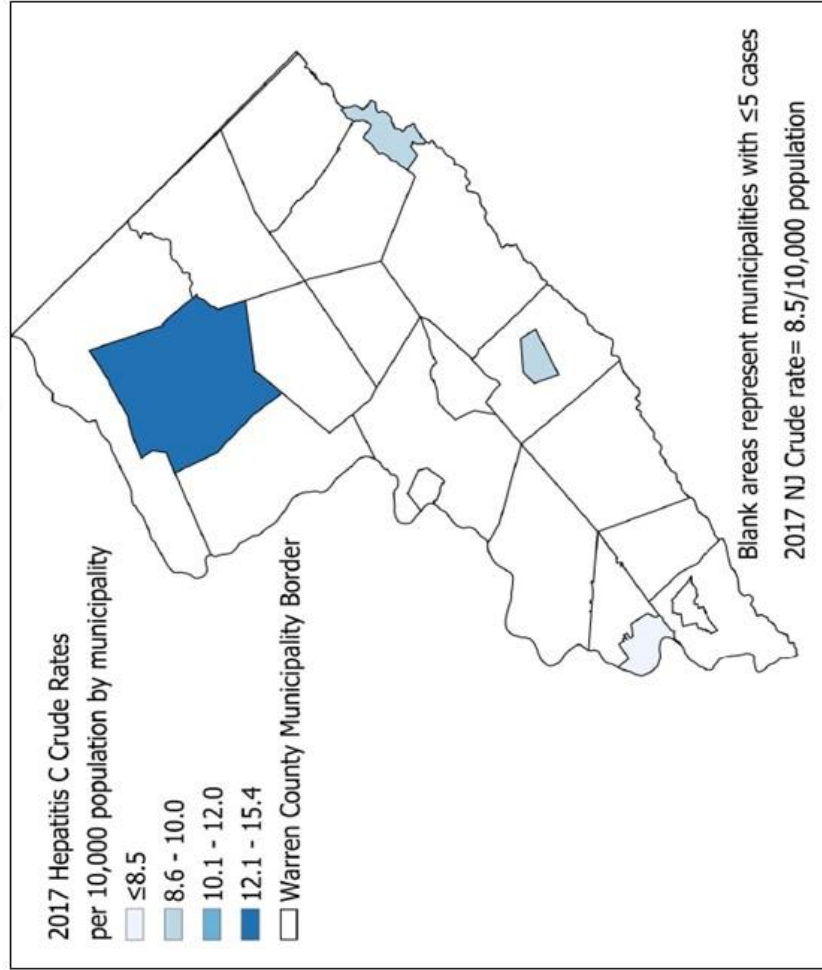

Warren County Known Risk Factors

Data source: Drug-related overdose deaths data were obtained from Center for Health Statistics and Informatics of NJDOH and Naloxone Administration data were obtained from NJDOHEMS
 Maps Created 7/15/2019

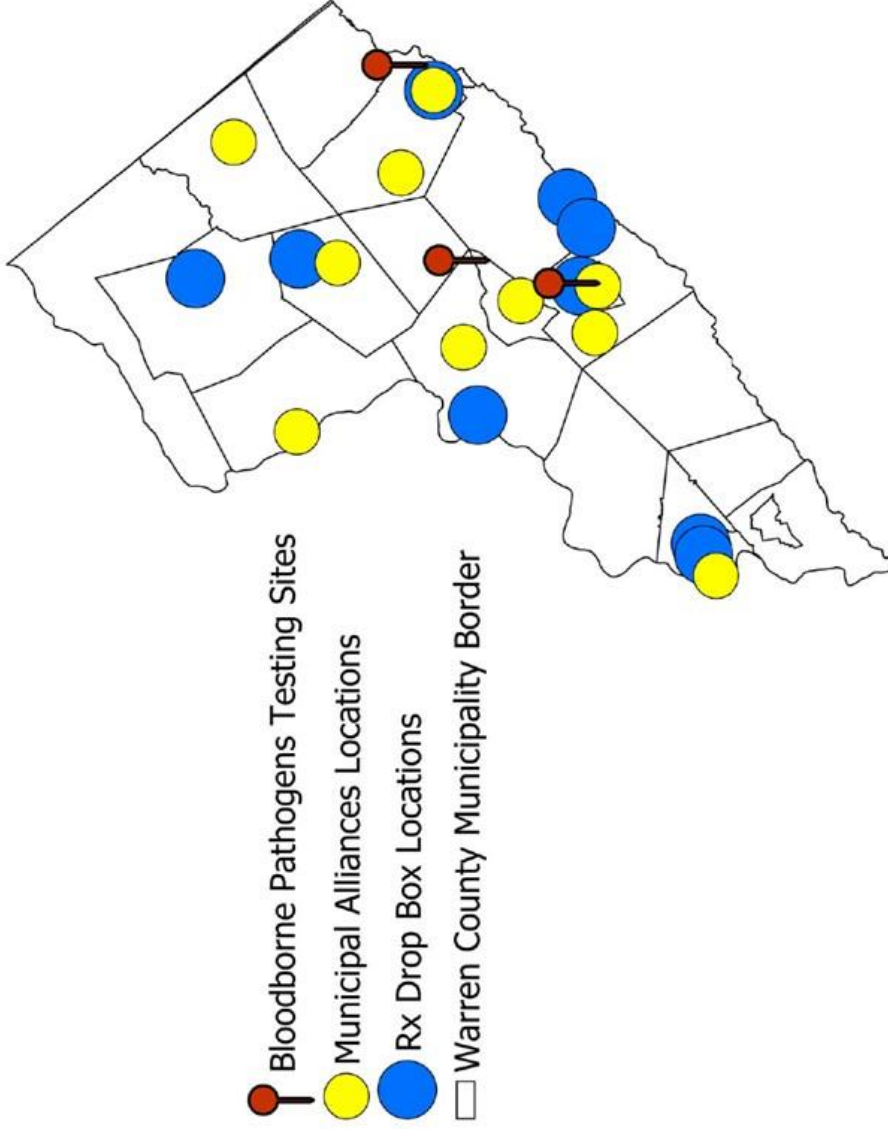

Warren County Hepatitis C and HIV Rates

Data Source: Hepatitis C data were obtained from Communicable Disease Reporting and Surveillance System
HIV/AIDS data were obtained from <https://www.nj.gov/health/hivstdb/>

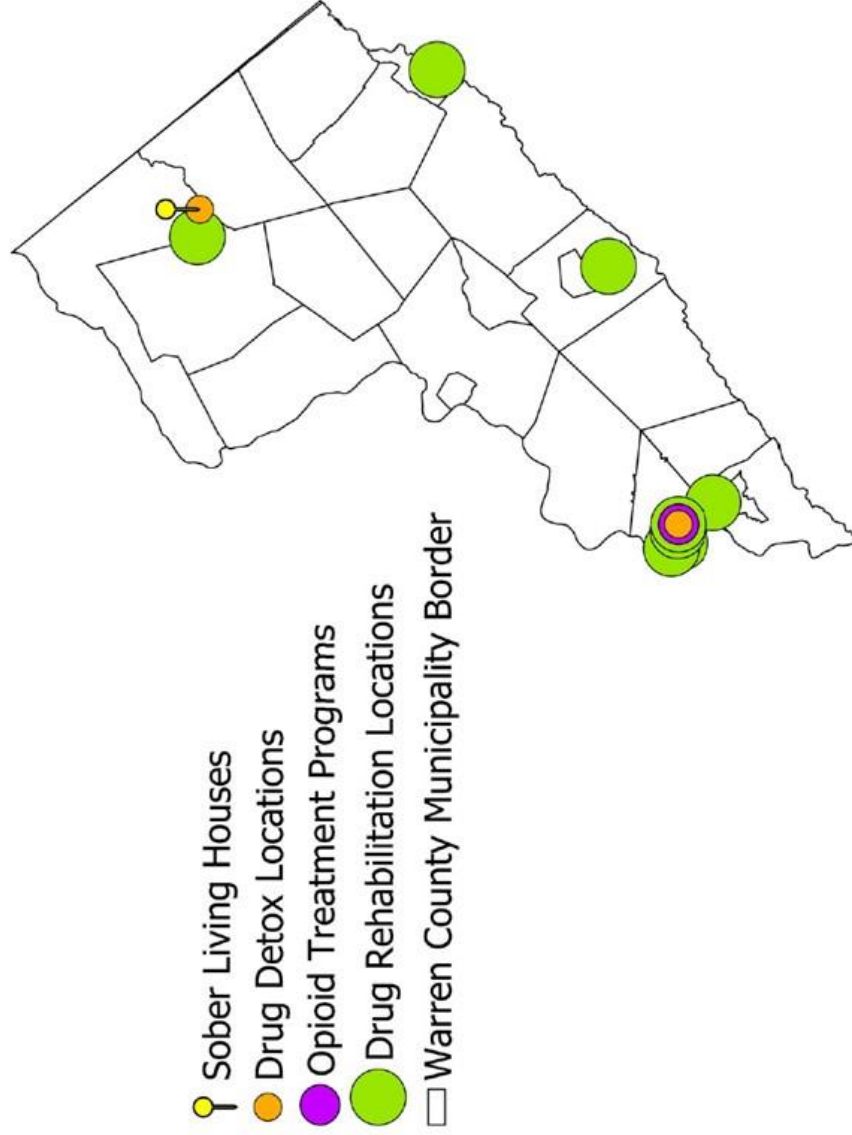

Warren County Harm Reduction and Prevention Services

Warren County Plan

Challenges:

1. Difficulty collecting or accessing local, community level data. Existing data is only available on a County wide level.
2. Stakeholder roles are not well defined in response, leading to lack of coordination and partnership in community response.
3. The current focus for the opioid response is reaction based only. This limits prevention funding and opportunities to address primary prevention strategies.
4. Insurance is dictating length and type of allowable care, not medical professionals, thus limiting options and access to needed acute and long-term care.
5. Limited priority placed on risk of blood borne pathogens (BBP) transmission in injection drug use population. Longer term recover programs are not able to get results of BBP testing done previously, missing an opportunity for treatment, vaccination and education.
6. Transportation and access to care is a concern. There are either none or limited treatment options, including Medication Assisted Treatment (MAT), detox and long-term recovery support services available within the County. This leave vulnerable populations at high risk for overdose or death.
7. Stigma and misinformation feeding professional and community level perceptions regarding addiction, screening, treatment and long-term recovery.

Opportunities & Future Actions:

1. Utilize current and future partners to promote effective cross sector work and to clearly define specific roles in prevention, screening, response, treatment and long-term recovery for injection drug users at risk for BBP. Personal and organizational buy in and community education can increase with defined role in response. Specific sectors to consider include:
 - a. Medical Community, Primary Care Practitioners and other Prescribers
 - b. Public Health Departments
 - c. Prevention Organizations
 - d. Treatment Facilities
 - e. Recovery Specialists
 - f. Law-Enforcement and other First Responders
 - g. Community
 - h. Schools
 - i. Parents and Families
 - j. Faith Based Communities

2. Identify missing partners, sectors and communities and work to engage their participation in the response and messaging. A particular emphasis should be placed on school partners.
3. Create resources for those directly interacting with drug users, including Police Officers, EMTs, Recovery Support professionals and Emergency Department Staff. Specific information related to screening for BBP, treatment and long-term recovery support services should be included.
4. Capitalize on current community relationships and stakeholders to provide educational opportunities for community members to reduce stigma and increase awareness. Specific items should include:
 - a. BBP transmission, screening, prevention and treatment
 - b. Prescription drug use and addiction
 - c. Process of addiction and long-term recovery
 - d. All treatment options, including MAT and documented effectiveness
 - e. Services available, including family support
 - f. Physician outreach to promote the availability of MAT
5. Provide education opportunities for the medical and public health community to reduce stigma and increase support for treatment access. Emergency Department staff, Primary Care Physicians, first responders, public health and prevention organization staff should be included.
6. Expand Stigma Free campaigns within the County, changing the perception of addiction and the collective community responsibility of supporting linkage to care, treatment and long-term recovery.
7. Explore best practices in other Counties to operationalize services in a mobile capacity and/or a Recover Center to meet people in need where they are providing all needed services in one location. This will provide more active connection to the community, providing education, testing for BBP and direct connection to Recovery Support professionals.
8. Evaluate the Overdose Fatality Review Team model and consider adopting within the County to steer future work and promote additional cross sector work.
9. Evaluate current Harm Reduction Centers in New Jersey Counties and provide information and education on purpose, safety and community impact to law and policy makers.
10. Evaluate the need and capacity for improving community support, services and education based upon the attached maps through continuous multi-sector meetings.
